

Post-treatment Information for Juliet Procedures

General Information:

The laser stimulates your body to rejuvenate itself. While many patients report immediate results, the improvement process continues and results are most noticeable about six weeks after the end of the protocol.

What you can expect:

Some women report slight redness, swelling, discharge or light bleeding. These are mild and will subside 1-2 days after treatment.

What you should do:

If you received PRP therapy, do not wash the area for at least 6 hours after treatment. To maximize the regenerative process, your doctor recommends avoiding hot baths and sexual activity for 72 hours after each treatment.

If you had Juliet with any Additional Procedures

If you had additional procedures at the same time as your Juliet procedure (such as removing skin tags, age spots and/or reducing scars or labia), then:

*An ointment, heavy cream or dressing may be applied to occlude the treated area. There may be a dressing to cover the area so the ointment does not get on your clothing. If you remove/replace the dressing, remember to follow specific instructions for post treatment care for that procedure as well.
